

Geometric Router: Paper-Grade System Figures

These figures illustrate the full architectural stack of the geometric routing model and the training dynamics used to learn routing structures and sparse activation patterns.

Full System Architecture

Geometric Router Full System Architecture

This diagram shows the major computational stages of the geometric routing model, from token embedding through routing, phase transport, event synapse activation, and retrieval before generating model outputs.

Training Dynamics

Training Dynamics of the Geometric Router

This figure illustrates how training proceeds through the routing architecture. Signals propagate through geometric routing and sparse activation layers before loss is computed. Gradients then propagate backward to update embeddings, routing geometry parameters, and synaptic thresholds.
