

DTR Command-and-Control Architecture

Browser Holospace -> HLIX -> ADDC -> UOR-ADDR -> OKO -> Smart-Assets

Corrected framing: ADDC refers to Arnouse Digital Devices Corporation. In this architecture, ADDC is the rugged, sovereign hardware execution surface. HLIX is the command and orchestration plane. OKO is added as the ledger / proof substrate that anchors infrastructure events and execution state.

Core Chain

Layer	Role in the Command Chain
Browser Holospace	Verifiable operator session; command/event captured as kappa / BLAKE3 state; identity and policy verification.
HLIX	Routing layer, orchestration layer, workload placement, and fleet coordination across target environments.
ADDC	Rugged sovereign hardware endpoints: BioDigitalPC clusters, mobile data centers, rack-mounted compute, and field-deployable infrastructure.
UOR-ADDR	Geometric object/reference model for state identity, addressability, and object continuity across environments.
OKO	Ledger / coordination substrate for transaction record, execution settlement, infrastructure state anchoring, and proof/event finality.
Smart-Assets	Economic rights, contributor payments, project funding, license/compliance monetization, and value distribution.

Operational Flow

1. Browser command is issued from a verifiable operator session.
2. The command becomes a signed / verifiable event.
3. HLIX routes the command and enforces policy.
4. ADDC hardware executes the workload or infrastructure action.
5. UOR-ADDR provides object/state reference and continuity.
6. OKO anchors the event, state, proof, and settlement record.
7. Smart-Assets distributes economic value and rights.
8. Proof and telemetry return to the browser session.

Compressed Architecture Statement

DTR can turn a browser session into a verifiable command node, route workloads through HLIX, execute on ADDC sovereign hardware, reference every object through UOR-ADDR, anchor execution/state through OKO, and settle value through Smart-Assets.

One-Line Strategic Implication

Browser = operator surface. HLIX = command and orchestration plane. ADDC = rugged sovereign compute hardware. UOR-ADDR = identity/reference model. OKO = ledger and proof substrate. Smart-Assets = economic settlement layer.
