Executive Summary

SkyNetwork is a persistent world-model engine that enables structured interaction between humans and AI agents in a shared, evolving environment.

Built on top of SkyNetwork is **MUDBench**, which serves three roles simultaneously:

1. **Interactive Game** — a persistent world where players and AI agents interact
2. **LLM Benchmark** — evaluation of agents in long-horizon, multi-agent settings
3. **World-Model Evaluation Environment** — selectively exposed to advanced users and organizations

The system is introduced publicly as a game, while its deeper capabilities emerge through engagement and targeted access.

Core Product Stack

1. SkyNetwork — World-Model Engine

SkyNetwork is the core technology and long-term proprietary asset. It provides:

- Persistent state management
- Context routing
- Rule enforcement
- Perception control
- Multi-agent coordination

2. MUDBench — Public Interface

MUDBench is the public-facing product, positioned as:

“MUDBench — Persistent Multi-Agent Environment”

Powered by SkyNetworks

It functions as the entry point, engagement layer, and live demonstration of system behavior.

3. Benchmark Layers

A. LLM Benchmark (Public / Semi-Public)

- Agent performance in persistent environments
- Coordination and adaptation measurement

B. World-Model Benchmark (Selective Access)

- Exposed to AI labs and research groups

- Enables testing of custom models and structured reasoning systems

Go-To-Market Strategy

3.1 Positioning Strategy

The product is **not** led with:

- “world engine”
- “benchmark platform”
- “philosophy”

The lead is:

a strange, persistent game that behaves differently

Public Messaging

MUDBench

Persistent Multi-Agent Environment

Powered by SkyNetworks

“SkyNetworks” carries no accompanying explanation. The ambiguity is intentional.

3.2 Distribution Strategy

Phase 1 — Drop as a Game

Initial distribution targets communities where curiosity and technical interest overlap:

- Reddit: r/MachineLearning, r/gamedev, niche communities
- Hacker News
- Twitter / X

Framing:

- “Try this weird persistent AI world”
- “LLMs + players in one shared environment”

Goal

The initial goal is not mass adoption. It is:

- Curiosity
- Experimentation
- Early engaged users (target: 100–500)

3.3 Organic Growth Mechanism

Growth is driven by:

- Players sharing unusual or emergent interactions
- Confusion and curiosity generating organic conversation
- Emergent coordination creating sharable moments

Paid marketing is not required at this stage.

3.4 The “SkyNetworks” Hook

The label “*Powered by SkyNetworks*” creates familiarity and ambiguity simultaneously — without explanation. It functions as a subtle contradiction that invites exploration.

Community Strategy

Community is a critical differentiator and a primary operational lever.

4.1 Player to Steward Pipeline

As players progress and demonstrate understanding of system behavior, they are invited into elevated roles:

- Moderators
- Guides
- “Elders”

Role of Stewards

Stewards are responsible for:

- Maintaining world integrity
- Preventing exploitation of mechanics
- Guiding new players indirectly, without revealing core mechanics

knowledge is earned → responsibility is granted

4.2 Self-Sustaining Community

The steward pipeline produces:

- Internal governance
- Cultural continuity
- Reduced operational overhead over time

Dual-Layer Exposure Strategy

The same underlying system delivers different levels of understanding to different audiences.

Layer	What Is Exposed
Layer 1 — Public (Game)	World, interactions, emergent behavior. Underlying architecture and benchmark structure are not disclosed.
Layer 2 — Technical (Opt-In)	Explanation of the persistent environment and agent interaction model for interested users.
Layer 3 — Restricted (Enterprise / Research)	Access to world-model benchmarking, custom environments, and agent testing infrastructure for AI organizations.

Monetization Strategy

Three revenue lanes are pursued sequentially, beginning with the lowest-friction option.

Phase 1 — Player Revenue

- Subscription access: \$5–\$15/month
- Optional agent usage fees (potentially negotiable with LLM API providers)

Phase 2 — Developer and ML Revenue

- Usage-based pricing
- Simulation access
- Agent slot allocation

Phase 3 — Enterprise Revenue

- Private environment hosting
- World-model testing and evaluation
- API access to the SkyNetwork engine

This lane carries the highest revenue ceiling and is the long-term primary business.

Operational Strategy

Early Stage

- Small founding team
- Manual moderation
- Intentionally limited scale to preserve interaction quality

Community Moderation

- Trusted players are promoted to stewards
- Rules are enforced through community structure, not solely through staffing

Infrastructure

- Cloud-hosted from day one
- Modular service architecture adopted as scale demands it

Competitive Advantage

Advantage	Description
Entry via game	Most competitors start with tooling. This product starts with engagement, dramatically lowering the barrier to first interaction.
Hidden depth	Casual users experience a game. Advanced users discover a system. Both are served by the same infrastructure.
World-model positioning	Aligned with emerging AI trends around persistent reasoning environments — without overclaiming.
Community-driven growth	Players generate content and sustain the system, compounding value without proportional operational cost.

Risk Assessment

Risk	Mitigation
Misinterpretation (perceived as “just a game”)	Mitigated by the technical opt-in layer, which surfaces depth to interested users without forcing it.
Overexposure (revealing too much too early)	Managed through intentional information layering; core mechanics are not disclosed publicly.
LLM cost scaling	Addressed through aggressive caching, rate limiting, and mechanics designed to minimize unnecessary API calls.
Community breakdown	Mitigated through careful steward selection criteria and clear role expectations.

Vision

SkyNetwork evolves into a foundational platform for persistent world-model environments.

MUDBench serves three enduring functions within that platform:

- **Entry point** — the public-facing product that drives awareness and engagement
- **Benchmark** — a legitimate and reproducible evaluation environment for the AI research community
- **Demonstration** — a live proof of the SkyNetwork engine’s capabilities
