Calvin and Hobbes comic about fairness

Rubber Band twisting....

Strings

Phi in the rubber band and spin escape prime theory

Iambic pentameter is a function of harmonics

Primes may be chess optimal strategy in base 16? Is that why #1 chess player in the world says if he knew when to look (maybe a prime?) he would always win. Means it's solvable, via phi

Music Phi harmonics

Guitar Phi? Does harmonics = primes in frets?

Racing phi best line - mass of car, speed entering turn, speed leaving turn, speed decrease, speed increase, turn angle, phi as best line, with breaking and accelerating occurring at maximum peak values at top of turn

Break = max speed = max speed - (max speed/phi) 100 = 59.52

59.52 = mph you need to be at at apex, also if your angle is exactly 1.618 (phi), you will need to slow down you'll need to begin slowing down at around 59.52 yards minimum to be able to do that.? Is never slowing down the best option... 59.52 probably needs to account for the angle of the turn somehow. - well actually, if you consider your break before the turn(100pmh), the apex(59.52mph), and your exit back at 100, you can consider the length as phi which is basically the sum of the other two lengths, so what we are missing is the breaking distance - since acceleration is 59.52 - you need to be entering the turn at 40.48mph to apex at 59.52mph and exit the turn at 100mph.

Phi as modeled in terms of Fractional orbital spin escape velocity via Spherical Harmonics, where phi builds dimensionality via prime numbers and phi

The theory I have a theory that all people personalities are are just built up around themselves to protect themselves from their greatest fear. Their greatest fear being some thing that happened to them probably when they were young, and made them more scared than anything else for me, and particular, my greatest fear I think is that someone I love will die so I do everything I can to try and prevent that or to try and put myself in a situation where I will have to experience the pain of

losing someone I love so in order for me to get better I have to give up that fear, and in order to do that I have to be OK with people that I love dying and I need to somehow figure out how to embrace the world despite the fact

Ww2 add we remember trauma

Some sort of math I invented to do quick multiplication to get out of homework quickly that my dad has never seen before

Innately good at things involving math

Always interested in physics

Automatically good at racing because intuitively understand something

My favorite game in school was number munchers, but specifically the prime munching game, where you had to munch higher and higher primes... I was by far the best at it in our school in 2nd grade. I loved that game and still think about it, although I do not count primes.

I don't think I am special

I am only describing all of this because I think its the only way I can show you what I've discovered and what it means in a way where I won't seem like a complete certifiable nut job - which maybe I am. But like I said, I think the only way I can describe it is by describing everything in my life that's happened to alter the way I think so I was able to reach the conclusion I did, and how.

Saw someone rated to openai write "implications of a solved world" and took it down

Sam Altman ousting

2010 papers on math leading to $x^x^{x^{\dots}}$

Spherical harmonics etc being used to some other things -

Closer and closer as we approach end of 2023... then see wolfram's observer theory and hear openai has made a potentially powerful discovery.

So when do we start reading Asimov's writings on robots to see how best we can proceed. The point of his stories were that his three laws were able to be gotten around in ways we haven't thought of. Maybe AI will help though, because they will realize even quicker what we have, and become benevolent sentiences that help us gracefully improve our future.

2023

Mayans were off by only 12 years... one clock rotation haha

New era of discovery - possibly new epoch of universe, possibly things will not exist that hadn't before... like elements. Maybe they will become less radioactive. Maybe we discover that previously extremely unstable elements are suddenly a little less unstable, and can help us with the future we needed to power its future.

Asimov pseudonym Paul French. Asimov doesn't know when he was born but it was probably either 1919 or 1920. He celebrated his birthday in January though and died in April.

Brother has a BPD friend name Paul French, born May Bro said may 15th.

I am may 27th

My ex is May 26 - we were chaos together - she is a prime 5 (may) and then 26, not a prime, but result of two 13s (all primes) - her chaotic dual nature? - I am a prime, 5, and not prime 27, divisible by 9 and 3, and 9 is divisibly by 3 and 3, so she is 5, 13, 2 - and I am 5, 3 - I don't think we come together well. I think I am a twin prime, while she is more a chaotic spike. But we have 5 in common, May, and we came together for 5 years. 27 might be special because it means I'm $5 - 3^3$ Maybe this is why they thing people born at the end of may are Gemini's and Gemini's are chaos. Or very close to dual personalities... I consider my own self to have a switch you can flip that leads to my absolute anger... so does that make me crazy too? Or does that just mean everyone has their breaking point? I think the people that behave against the grain are the true heroes. The ones who battle entropy, not just wait for the inevitable downfall. But it's not any of our faults. The universe will balance out one way or the other. Primes consequences of going against the grain. They represent change.
