

Physics

SO(10) for GUT

Do spins eventually drag two massive black holes, swallowing spacetime, spinning in opposite directions and colliding to a naked singularity of GUT mass/energy and Black holes

Create new universes?

Breakdown of dimensions?

Feeds mass through

Universe Mass is equal to a black hole radius that would be equal to our observable universe

Inflation via Breaking of nuclear interaction creates third dimension and Higgs field introduces a ton of mass

Higgs field breaks electroweak and increases inflation again via more mass increase via atoms weak interactions.

Black holes then must reverse entropy, although an observer wouldn't be able to tell.

Gravity is what creates movement aka passage of time. If spin is opposite of gravitational it'll expel at close distances overpowering gravity creating the Big Bang.

One dimension and one time dimension, split, to physical dimensions can contain mass, inflation + heat, big bang, quarks now form plasma. Plasma slowly becomes, protons and neutrons, Higgs field split eventually, weak forces cause nuclear decay and electromagnetic forces create atoms, molecules and beyond. Gravity keep insuring a spin. One dimension all spin same. Time is always part of first dimension. When physical dimension split into two, spin split directions, thus accounting for chirality.

Quantum theory: we live in the most probable of all possible universes.

Universe is a 4D gravitational monopole that opposite spins in time Higgs. Universe essentially starts in bounce. Magnet force non existent. Gravity slowly splits Higgs. Where Higgs is at max potential and EM is at 0. Gravity too is max potential but 0 kinetic spin as they all instantly connect and current spin cancels. Once temps reach low enough in our universe, not quite absolute 0, all EM becomes electronic monopoles and expel magnet force everywhere in the universe, this reverses the spins of gravity and reverses entropy. Once heat rises, eventually symmetry at various levels. The magnet monopole moment vanishes, but reverse spin of gravity drives reverse entry to collapse the universe again to a single dimension with maximum gravity potential of the "universal 4d monopole"

and maximum Higgs kinetic, maximum EM potential, 0 em kinetic.

At absolute zero the universe is special relativity.

Mass field lives in between the vacuum and the anti vacuum. Anti vacuum has antigravity.

Do all fields live in this zone?

Or is Higgs where supersymmetry meets?

Higgs held away by 4D anti-(spin/gravity) messiner effect.

Gravity spin split pulls Higgs from fixed position to scalar field where both quantum fluxes exist

Chamber of magnet field spin quickly and shrank quickly may alter magnet field or spin of particles inside?

Back in time?
