

## What a time to be alive

Post COVID we all are living in a fairly uncertain time in history. Taylor Swift has more political swing than is needed for a congressional majority. AI and Quantum Computing are certainly things we can look forward to in some sense. Meanwhile the ridiculous juxtaposition exists where the fate of the Ukrainian people may be decided by the systemically undereducated American Public, when they reelect Trump. Meanwhile antisemitic groups are trying to align themselves with antiglobalization movements. But not to worry, my new iPhone, my groceries, and my anti-anxiety medication should all be arriving today, and I think I saw that the new season of the Bachelor is available on Hulu tonight, so things are looking up. Now, if only I could find a nice union job, and if my Uber Eats order would hurry, life would be perfect. Oh here's something funny. The US stock market is now something like 4-5 times higher than it ever was before Trump took office. People think Tesla is the answer to climate change. The real answer has been available since the 30s. Nuclear energy is scary though... so what are we to do? Meanwhile, relatively and Particle Physics stand poised to be united, if the money is there. But there's not a lot of motivation for innovation when there isn't a new weapon at stake. I think in our lifetime we might invent AI, we might solve and unify physics, we might realize our universe is deterministic, and we might begin our own simulation.
